**Certeon Delivers Virtual Appliance for Application Acceleration to  
Run on Windows Server 2008 Hyper-V**

*-- aCelera Reduces Application Response Time Across the WAN by 95 Percent --*

**BELLEVUE, Wash. – Sept. 8, 2008 –** [Certeon](#) today announced that its *aCelera*™ Virtual Appliance software for application acceleration will be shipping with support for Microsoft Windows Server 2008 Hyper-V in its upcoming November 2008 release. This announcement is a continuation of a commitment [Certeon made when it launched aCelera](#) to end the era of proprietary application acceleration appliances.

Certeon's *aCelera* Virtual Appliance software delivers a greater than 95 percent reduction in application response time for applications being accessed across the wide area network (WAN), with the added benefit of eliminating the hardware footprint and high cost of separately managed single-purpose hardware appliances. Certeon's *aCelera* software resides inside virtualized data centers and branch offices resulting in increased manageability, scalability, user productivity, and lower total cost of ownership. With this announcement, Certeon is adding Microsoft Windows Server 2008 Hyper-V to its supported virtualization environments. Further solidifying its strategic relationship with Microsoft, Certeon is a silver sponsor for the Microsoft Get Virtual Now launch event today.

"aCelera's support of Windows Server 2008 Hyper-V enables enterprises to maximize their investment in cost-effective virtualized environments," said Peter Dougherty, president and CEO of Certeon. "By incorporating acceleration into a virtualized infrastructure, aCelera helps businesses reduce operational costs, simplify the deployment of application acceleration, and enhance user productivity."

*aCelera* Virtual Appliance software is the perfect union of virtualization and application acceleration delivering a combination of performance, scalability, flexibility, and easy management. *aCelera* is hypervisor-agnostic and supports high performance remote application access in mixed Windows Server 2008 Hyper-V and VMware environments. In addition, *aCelera*

can be centrally managed and controlled through its compatibility with Microsoft System Center Virtual Machine Manager 2008—enabling IT managers to allocate and manage application performance resources from a single location.

“Certeon’s ability to integrate its high-performance application solutions with support for Windows Server 2008 Hyper-V and the powerful management capabilities of System Center provides customers with new methods of maximizing the ROI from their virtual infrastructure investment,” said Zane Adam, senior director of integrated virtualization at Microsoft.

*aCeler*a improves the performance of all remotely accessed applications while turbo-charging such mission critical applications as enterprise content management, Web-based collaboration, and product life cycle management. *aCeler*a Virtual Appliances are optimized to accelerate remote access to Microsoft Office and Microsoft Office SharePoint Server, as well as many other distributed applications. *aCeler*a for Windows Server 2008 Hyper-V will be available in November 2008.

### **About Certeon**

Certeon’s *aCeler*a Virtual Appliance software is the industry’s first and only virtual appliance to deliver acceleration, virtualization and manageability when remotely accessing applications throughout a distributed enterprise. *aCeler*a Virtual Appliances reduce application response time over the WAN by more than 95% without proprietary hardware appliances. *aCeler*a is optimized for mission critical applications such as: enterprise content management, Web-based collaboration, and wide area file services. *aCeler*a is flexible and easy to deploy delivering faster, more scalable applications, and enabling greater user productivity. Founded in 2003, Certeon is a private company, headquartered in Burlington, Massachusetts. For more information, visit [www.certeon.com](http://www.certeon.com) or call 781-425-5200.
